***Abstract*—In this report, we present our solution to the 1996 AAAI Mobile Robotics Competition task "Call a meeting"[1]. We give some background information about the areas of robotics that are relevant to the problem, with brief reference to literature. We then provide a detailed description of our system and evaluate its performance. Finally, we discuss the experimental results and suggest areas for improvement.**

I. Background

A. Robot Motion

holonomic robots, PID control, reactive control

B. Localisation

Algorithm 1 Basic Monte Carlo Localisation[2]

Algorithm MCL($\mathcal{X}_{t-1}, u_t, z_t, m$)
$\bar{\mathcal{X}}_t = \mathcal{X}_t = \emptyset$
for $m = 1$ to M **do**
  $x_t^{[m]} =$ **sample_motion_model**($u_t, x_{t-1}^{[m]}$)
  $w_t^{[m]} =$ **measurement_model**($z_t, x_t^{[m]}, m$)
  $\bar{\mathcal{X}}_t = \bar{\mathcal{X}}_t + \langle x_t^{[m]}, w_t^{[m]} \rangle$
end for
for $m = 1$ to M **do**
  draw i with probability $\propto w_t^{[m]}$
  add $x_t^{[i]}$ to $\bar{\mathcal{X}}_t$
end for
return $\bar{\mathcal{X}}_t$

Bayes filter, Kalman filter, particle filter (MCL), small section about mapping—still an active area of research in robotics. Mention SLAM, which has been pretty much solved.

C. Route Planning

Algorithm 2 Path Flattening

Algorithm flatten_path(path, iterations, map)
newpath ← path
for $i := 0$ **to** iterations **do**
  for $j := 0$ **to** len(path)-2 **do**
    $A \leftarrow$newpath(i)
    $B \leftarrow$newpath($i+1$)
    $C \leftarrow$newpath($i+2$)
    if freely_connected(map,A, C) **then**
      newpath.remove(B)
    end if
  end for
end for
return newpath

PRM (sampling methods, graph search), RRT

D. Exploration

frontier based techniques

E. Robot Vision

II. Design

A. System Structure

MENTION ALGORITHM COMPLEXITY! brief ROS description, callback based system, finite state automaton

B. Platform

Stuff about the pioneer—available sensors, some data about its size, specifications, our additions to it. Kinect specs. Include a picture of the robot with the kinect on it.

III. Experimentation

A. PRM

inflated map - show inflated map superimposed onto the original map Redo experiment for sampling methods. short, medium, long path length. Display image of map with one of the routes displayed and show the difference between the sampling methods. Find the optimum route by sampling a massive number of vertices on to the space and then finding a route using that—the flattened path is then the most optimal route, and we compare the other routes to this route for each experiment.

B. Vision

C. Exploration

IV. Discussion

A. Performance

B. Potential Improvements

C. Conclusions
